

Parameter Estimation

Can be refined to $n^{-\frac{1}{2(k-k_0+1)}}$ when modes form k_0 well-separated clusters! (Heinrich & Kahn 2018)

Parameter Estimation

Many similarities to classical locally adaptive methods!

- ϵ -neighborhoods, k -nearest neighbors
- l_1 -regularized Wavelet approximation
- Voronoigram (Hu et al. 2022)

Can splats optimally estimate for BV function?
